## Problem B: Mountainous landscape

You travel through a scenic landscape consisting mostly of mountains - there are $n$ landmarks (peaks and valleys) on your path. You pause for breath and wonder: which mountain are you currently seeing on the horizon?

Formally: you are given a polygonal chain $P_{1} P_{2} \ldots P_{n}$ in the plane. The $x$ coordinates of the points are in strictly increasing order. For each segment $P_{i} P_{i+1}$ of this chain, find the smallest index $j>i$, for which any point of $P_{j} P_{j+1}$ is visible from $P_{i} P_{i+1}$ (lies strictly above the ray $\left.P_{i} P_{i+1}\right)$.

## Input

The first line of input contains the number of test cases $T$. The descriptions of the test cases follow:

The first line of each test case contains an integer $n(2 \leqslant n \leqslant 100000)$ - the number of vertices on the chain.

Each of the following $n$ lines contains integer coordinates $x_{i}, y_{i}$ of the vertex $P_{i}\left(0 \leqslant x_{1}<\right.$ $x_{2}<\ldots<x_{n} \leqslant 10^{9} ; 0 \leqslant y_{i} \leqslant 10^{9}$ ).

## Output

For each test case, output a single line containing $n-1$ space-separated integers. These should be the smallest indices of chain segments visible to the right, or 0 when no such segment exists.

## Example

| For an example input | the correct answer is |
| :---: | :---: |
| 2  <br> 8  <br> 0 0 <br> 3 7 <br> 6 2 <br> 9 4 <br> 11 2 <br> 13 3 <br> 17 13 <br> 20 7 <br> 7  <br> 0 2 <br> 1 2 <br> 3 1 <br> 4 0 <br> 5 2 <br> 6 1 <br> 7 3 | $\begin{array}{lllllll} \hline 0 & 3 & 6 & 5 & 6 & 0 & 0 \\ 6 & 4 & 4 & 0 & 6 & 0 & \\ \hline \end{array}$ |
